(54) Title: META-BENZAMIDINE DERIVATIVES AS SERIN PROTEASE INHIBITORS**(57) Abstract**

The invention relates to serine protease inhibitor compound of formula (I), where R₁ and R₂ each independently is hydrogen or hydroxyl, alkoxyl, alkyl, aminoalkyl, hydroxyalkyl, alkoxyalkyl, alkoxyacetyl, acyloxymethoxycarbonyl or alkylamino optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl; each R₃ independently is R₁, R₂, amino, halo, cyano, nitro, thiol, alkylthio, alkylsulfonyl, alkylsulphenyl, alkylsulphonamido, alkylaminosulphonyl, haloalkoxy and haloalkyl; each X independently is C, N, O or S atom or a CO, CR₁, C(R₁)₂ or NR₁ group, at least one X being C, CO, CR₁ or C(R₁)₂, with the proviso that if the benzamidine group is unsubstituted and the X-X group is -CH₂C(R₁)₂-, then R₁ is hydrogen or is attached to the alkylene carbon atom by a heteroatom; L is an organic linker group containing 1 to 5 backbone atoms selected from C, N, O and S, or a branched alkyl or cyclic group; Y is a nitrogen atom or a CR₁ group or Y and L taken together form a cyclic group; Cy is a saturated or unsaturated, mono or polycyclic, homo or heterocyclic group optionally substituted by groups R₃ or phenyl optionally substituted by R₃; Lp is a lipophilic organic group, selected from an alkyl, heterocyclic, alkenyl, alkaryl, cycloalkyl, polycycloalkyl, cycloalkenyl, aryl, aralkyl or haloalkyl group or a combination of two or more such groups optionally substituted by one or more of oxa, oxo, aza, thio, halo, amino, hydroxy or R₃ groups; D is a hydrogen bond donor group; and n is 0, 1 or 2 and salts thereof.

META-BENZAMIDINE DERIVATIVES AS SERIN PROTEASE INHIBITORS

5 This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof and their use in the treatment of the human or animal body.

10 The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase, thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase, α -lytic protease, protease A, protease B, 15 serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa. The serine proteases have been investigated extensively over a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

20 Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization, development, malignancy, neuromuscular patterning and inflammation. It is well known that 25 these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular processes, such as adhesion, migration, free radical 30 production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

35 Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as

- 2 -

oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

Thus for example an inhibitor of Factor Xa has value as a therapeutic agent as an anticoagulant, e.g. in the treatment and prevention of thrombotic disorders. The use of a Factor Xa inhibitor as an anticoagulant is desirable in view of the selectivity of its effect. Many clinically approved anticoagulants have been associated with adverse events owing to the non-specific nature of their effects on the coagulation cascade.

Also, there are well-known associations of $\alpha 1$ protease inhibitor deficiency with emphysema and cirrhosis and C1 esterase inhibitor deficiency with angioedema.

We have now found that certain novel amidine compounds are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and most especially the serine proteases thrombin, trypsin, urokinase and Factor Xa.

Thus viewed from one aspect we provide serine protease inhibitor compounds having an m-benzamidine group and a lipophilic group coupled to a cyclic group-attached carbon or nitrogen atom (hereinafter the alpha atom), the coupling of the m-benzamidine group to the alpha atom being by a linker group providing a two backbone atom linking chain, the backbone atoms being selected from C, N, O and S and at least one being C, optionally wherein one or both of the backbone atoms form part of a cyclic group and the coupling of the lipophilic group to the alpha atom being by a linker group capable of separating the alpha atom from the

- 3 -

lipophilic group by a range of 2.3 to 6.5 Å in length.

In the compounds of the invention, the lipophilic group is itself optionally substituted by a hydrogen bond donor group. Where this is the case, the lipophilic group and its linker preferably are conformable to separate by from 7.5 to 15.0 Å the alpha atom and the hydrogen bond donor atom of the donor group.

Where distances from the alpha atom to the lipophilic group or to the hydrogen bond donor atom are mentioned, these relate to the distances between the centre of the alpha atom and the centre of the first atom of the lipophilic group or the centre of the hydrogen bond donor atom.

Such distances can be calculated from crystallographic data for any given compound from the bond lengths and bond angles for individual bonds along the length of the molecule between the alpha atom and the first atom of the lipophilic group or the hydrogen bond donor atom. Similarly such distances may be calculated with reasonable accuracy from the bond lengths and bond angles known to be typical of such individual bonds.

The linker between the alpha atom and the lipophilic group may itself be a lipophilic moiety, e.g. an alkylene chain. The nature of the linker may vary considerably - the primary requirement is that it be conformable to place part or all of the lipophilic group at a desired distance away from the alpha atom. The lipophilic group thus desirably is able to occupy at least part of a space 2.3 to 15.0 Å from the alpha atom. The length of the linker generally corresponds to 1 to 5 backbone atoms and may be a chain, branched chain or cyclic linker (e.g. a cyclic amide or an aromatic heterocycle). In one embodiment the alpha atom forms part of a cyclic group which also forms the linker to the lipophilic group.

- 4 -

Thus viewed from an alternative aspect the invention provides serine protease inhibitor compounds of formula I

(where R_1 and R_2 each independently is hydrogen or hydroxyl, alkoxy, alkyl, aminoalkyl, hydroxyalkyl, alkoxyalkyl, alkoxycarbonyl, acyloxymethoxycarbonyl or alkylamino optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl;

15 each R_3 independently is R_1 , R_2 , amino, halo, cyano, nitro, thiol, alkylthio, alkylsulphonyl, alkylsulphenyl, alkylsulphonamido, alkylaminosulphonyl, aminosulphonyl, haloalkoxy and haloalkyl;

20 each X independently is a C, N, O or S atom or a CO, CR_1 , $C(R_1)_2$ or NR_1 group, at least one X being C, CO, CR_1 or $C(R_1)_2$, with the proviso that if the benzamidine group is unsubstituted (i.e. no non-hydrogen R_3 group is present) and the X-X group is $-CH_2C(R_1)_2-$ then R_1 is hydrogen or is attached to the alkylene carbon atom by a heteroatom;

25 L is an organic linker group containing 1 to 5 backbone atoms selected from C, N, O and S, or a branched alkyl or cyclic group;

30 Y (the α -atom) is a nitrogen atom or a CR_1 group or Y and L taken together form a cyclic group;

35 Cy is a saturated or unsaturated, mono or poly cyclic, homo or heterocyclic group, preferably containing 5 to 10 ring atoms and optionally substituted by groups R_3 or phenyl optionally substituted by R_3 ;

Lp is a lipophilic organic group, e.g. an alkyl,

- 5 -

heterocyclic, alkenyl, alkaryl, cycloalkyl, polycycloalkyl, cycloalkenyl, aryl, aralkyl or haloalkyl group or a combination of two or more such groups optionally substituted by one or more of oxa, oxo, aza, thio, halo, amino, hydroxy or R_3 groups, preferably a group containing up to 25 carbon atoms;

D is a hydrogen bond donor group; and n is 0, 1 or 2);

or a physiologically tolerable salt thereof, e.g. a halide, phosphate or sulphate salt or a salt with ammonium or an organic amine such as ethylamine or meglumine.

In the compounds of the invention, where the alpha atom is carbon it preferably has the conformation that would result from construction from a D- α -amino acid $NH_2-CR_1(Cy)-COOH$ and a m-carboxyl benzamidine. Likewise the fourth substituent R_1 at an alpha carbon is preferably a methyl or hydroxymethyl group or hydrogen.

In compounds of formula (I) it is envisaged that the unsubstituted or substituted amidino group could be replaced by a substituted or unsubstituted aminomethyl group although an amidino derivative is preferred.

In the compounds of the invention, unless otherwise indicated, aryl groups preferably contain 5 to 10 ring atoms optionally including 1, 2 or 3 heteroatoms selected from O, N and S; alkyl, alkenyl or alkynyl groups or alkylene moieties preferably contain up to 6 carbons; cyclic groups preferably have ring sizes of 3 to 8 atoms; and fused multicyclic groups preferably contain 8 to 16 ring atoms.

The linker group from the benzamidine group to the alpha atom is preferably selected from $-CH=CH-$, $-CONH-$, $-CONR_1-$, $-NH-CO-$, $-NH-CH_2-$, $-CH_2-NH-$, $-CH_2O-$, $-OCH_2-$, $-COO-$, $-OC=O-$ and $-CH_2CH_2-$. Preferably, the X moiety nearest to the alpha atom is an NH or O atom, most preferably a NH group. The X moiety alpha to the phenyl ring is preferably a carbon based group such as CH_2 or

- 6 -

CO, preferably CO. Thus a particularly preferred linker X-X is -CONH-.

The linker group from the alpha atom to the lipophilic group is preferably CO, CH₂NH, CONR₁(CH₂)_m,
5 (CH₂)_mN(R₁)CO(CH₂)_m, (CH₂)_{m+2}, CO(CH₂)_m, (CH₂)_mCO, (CH₂)_mOC=O, (CH₂)_mO or CH=CH(CH₂)_m (where each m is independently 0 or 1). The linker may be optionally branched, for example, to incorporate a polar functionality. In a preferred embodiment Y and L taken together form a cyclic group
10 and the alpha atom is therefore a carbon atom. The cyclic group can be unsubstituted or substituted and can have a ring size of from 3 to 8 atoms. Preferably, the cyclic group is a cyclic amide, most preferably wherein the amide nitrogen of the cyclic amide group is bound to
15 the lipophilic group.

The lipophilic group preferably comprises a cycloalkyl, azacycloalkyl, diazacycloalkyl, phenyl, naphthyl, adamantyl, decalynyl, tetrahydrodecalynyl, bicycloalkyl, mono- or diazabicycloalkyl, mono- or
20 bicyclo heteroaromatic or a linear or branched alkyl, alkylene, alkenyl or alkenylene group all optionally substituted by one or more groups R₃, or a combination of at least two such groups linked by a spiro linkage or a single or double bond or by C=O, O, S, SO, SO₂, CONR₁,
25 NR₁-CO-, NR₁ linkage. For example, representative lipophilic groups include a methyl-cyclohexyl, methylcyclohexylmethyl, methylphenylmethyl, phenylethyl, benzylpiperidinyl, benzoylpiperidinyl, bispiperidinyl or phenylpiperazinyl.

30 Most preferably, the lipophilic group is selected from

- 8 -

wherein R_3 is R_1 , aryl or cycloalkyl;
 m represents 0 or 1;
 R_4 represents hydrogen, $(CH_2)_wCOOH$, $(CH_2)_wCONH_2$,
 $(CH_2)_wCON\alpha$ -AminoAcid;
 w represents an integer from 0 to 4; and
 X represents CH or N.
 For example specific lipophilic groups include

10

15

20

25

30

35 especially when R_8 represents H, OMe, F, NO_2 , OH or Cl.

- 9 -

The hydrogen bond donor group which may be attached to the lipophilic group preferably has a nitrogen or oxygen atom as the donor atom and conveniently is a hydroxyl group, a primary, secondary or tertiary amine, or a primary or secondary imine group (as part of an amidine or guanidine) or a saturated or unsaturated heterocyclic group containing a ring nitrogen, preferably a group containing 5 to 7 ring atoms. Where the donor atom is a ring nitrogen, the remote portion of the heterocyclic ring may be part of the lipophilic group.

The cyclic group attached to the alpha carbon is preferably an optionally R_3 substituted phenyl or naphthyl group.

The benzamidino group is preferably an unsubstituted m-benzamidino group, or a substituted m-benzamidino group bearing metabolically labile groups such as acyloxymethoxycarbonyl, alkoxycarbonyl or hydroxy.

Accordingly, preferred compounds of the invention are of formula

30

(wherein R_1 , R_2 and R_3 are as hereinbefore defined, R_1 and R_2 preferably being hydrogen or one representing a metabolically labile group such as alkoxycarbonyl or hydroxy, R_3 preferably being hydrogen, OH or NH_2 and when other than hydrogen preferably being para to the amidine group);

R_5 and R_6 are hydrogen or taken together with the

- 10 -

carbon atom to which they are attached represent a carbonyl group;

Ar is an unsubstituted or substituted aryl group, preferably phenyl;

5 X-X is -CONH-, -CH₂CH₂-, CH₂O-, -COO-, -CH₂NH-, -OCH₂- or -NHCH₂-;

L₁ is a valence bond or an organic linker group containing 1 to 4 backbone atoms selected from C, N and O;

10 Lp₁ is a cycloalkyl, azacycloalkyl, diazacycloalkyl, phenyl, naphthyl, adamantyl, decaliny, tetrahydrodecaliny, bicycloalkyl, mono- or diazabicycloalkyl, mono- or bicyclo heteroaromatic or a linear or branched alkyl, alkylene, alkenyl or
15 alkenylene group all optionally substituted by a group R₃, or a combination of at least two such groups linked by a spiro linkage or a single or double bond or by C=O, O, S, SO, SO₂, CONR₁, NR₁-CO-, NR₁ linkage. For example, representative lipophilic groups include a methyl-
20 cyclohexyl, methylcyclohexylmethyl, bispiperidinyl, methylphenylmethyl, phenylethyl, benzylpiperidinyl, benzoylpiperidinyl or phenylpiperazinyl and those as hereinbefore described;

D is a hydrogen bond donor group;
25 and n is 0, 1 or 2).

In one embodiment, L₁ comprises the backbone of an alpha amino acid, the lipophilic group being the side chain of the amino acid. The carboxyl part of the alpha amino acid may be optionally coupled via an amide bond
30 to an amino acid or to a primary or secondary cyclic or acyclic alkyl amine or diamine or via an ester bond to primary or secondary alcohols.

In a preferred embodiment, L₁ represents a valence bond and the lipophilic group is bound directly to the
35 carbonyl alpha to the alpha atom via a nitrogen atom which forms part of the lipophilic group. Suitable lipophilic groups in this case therefore include

- 11 -

piperidinyl, pyrrolidinyl and piperazinyl. In a preferred embodiment the piperidine or piperazinyl group is further substituted by a phenyl, benzyl, piperidine, pyridine or benzoyl group, optionally substituted on the phenyl ring by one or more R_3 groups.

In a further embodiment, the lipophilic group has attached a group of the formula $-COOR_1$ or $-CON$ -aminoacid or ester derivative thereof.

In another embodiment the group binding the alpha carbon atom to the lipophilic group comprises a heterocyclic group. Accordingly, preferred compounds of the invention also include

(wherein R_1 , R_2 and R_3 are as hereinbefore defined R_1 and R_2 preferably being hydrogen or one representing a metabolically labile group such as alkoxycarbonyl or hydroxy, R_3 preferably being hydrogen, OH or NH_2 and when other than hydrogen preferably being para to the amidine group);

Ar is an unsubstituted or substituted aryl group, preferably phenyl;

$X-X$ is $-CONH-$, $-CH_2CH_2-$, CH_2O- , $-COO-$, $-CH_2NH-$, $-OCH_2-$ or $-NHCH_2-$;

m is 0, 1 or 2;

Het is a 5 or 6-membered heterocyclic group interrupted by 1, 2 or 3 heteroatoms selected from O, N and S optionally substituted by a group R_3 ;

Lp_1 is a cycloalkyl, azacycloalkyl, diazacycloalkyl, phenyl, naphthyl, adamantyl, decalanyl, tetrahydrodecalanyl, bicycloalkyl, mono- or diazabicycloalkyl, mono- or bicyclo heteroaromatic or a

- 12 -

linear or branched alkyl, alkylene, alkenyl or
alkenylene group all optionally substituted by a group
R₃, or a combination of at least two such groups linked
by a spiro linkage or a single or double bond or by C=O,
5 O, S, SO, SO₂, CONR₁, NR₁-CO-, NR₁ linkage. For example,
representative lipophilic groups include a methyl-
cyclohexyl, methylcyclohexylmethyl, methylphenylmethyl,
phenylethyl, benzylpiperidinyl, benzoylpiperidinyl,
bispiperidinyl or phenylpiperazinyl;

10 D is a hydrogen bond donor group;
and n is 0, 1 or 2).

Where Het is a five membered ring, the two ring
atoms at which it is connected are preferably separated
by one ring atom. Where Het is a six-membered ring, the
15 two ring atoms at which it is connected are preferably
separated by one or two ring atoms. Representative
heterocyclic groups include thiazole, oxazole,
oxadiazole, triazole, thiadiazole or imidazole. Where
the heterocyclic group is substituted by R₃ this is
20 preferably a COOH or COOR₁ connected to the heterocycle
via a valence bond or alkylene chain.

In a further embodiment, the lipophilic group has
attached a group of the formula -COOR₁ or -CON-aminoacid
or ester derivative thereof.

25 The compounds of the invention may be prepared by
conventional chemical synthetic routes, e.g. by amide
bond formation to couple the benzamidine function to the
alpha atom and to couple the lipophilic function to the
alpha atom. Where the alpha atom is a carbon, the
30 cyclic group-alpha atom combination may conveniently
derive from an alpha amino acid with the benzamidine
deriving from a m-amidino-benzoic acid. Amide formation
from such reagents (in which the amidine function may if
desired be protected during some or all of the synthesis
35 steps) yields a compound of formula II.

- 13 -

(where Cy is as defined above and Bd is an optionally protected m-benzamidine group).

The lipophilic group (and optionally simultaneously the hydrogen bond donor) may then conveniently be introduced by reaction of a compound of formula II (or another analogous carboxylic acid) optionally after transformation into an activated form, e.g. an acid chloride or active ester, with a lipophilic group carrying an amine, hydroxylamine, hydrazine or hydroxyl group, e.g. to produce compounds with linkages of -CO-NR₁-, -CO-NR₁-O-, -CO-NR₁-NR₁- and -CO-O- from the alpha atom (where it is a carbon) to the lipophilic group. Where Y and L taken together form a cyclic amide group the lipophilic group can be conveniently introduced by reacting the compound of formula (II) with a lipophilic group carrying a secondary amine with an active side chain. Cyclisation can be base induced via nucleophilic attack of the alpha atom on a leaving group on the active side chain. If necessary the amide linkage can be reduced using an appropriate reducing agent employing the necessary protection depending on whether concurrent reduction of the carboxylic acid moiety is also desired. Alternatively a compound of formula II or another analogous carboxylic acid may be transformed into an alcohol by reaction with isobutylchloroformate and reduction with sodium borohydride.

Such an alcohol, e.g. of formula III

can be reacted to introduce the lipophilic group by reactions such as:

alkylation with an alkyl halide in the presence of a base;

reaction with diethyl azodicarboxylate/triphenylphosphine and a hydroxylated aryl compound;

- 14 -

by reaction with an activated carboxylic acid (e.g. an acid chloride) or with a carboxylic acid and diethylazodicarboxylate/triphenylphosphine;

by reaction with an isocyanate; and

5 by treatment with methanesulphonyl chloride or trifluoromethanesulphonic anhydride and reaction with an amine, or with a thiol optionally followed by oxidation, e.g. with potassium metaperiodate or hydrogen peroxide.

10 In this way compounds with linkages of $-\text{CH}_2-\text{O}-$, $-\text{CH}_2-\text{O}-\text{CO}-$, $-\text{CH}_2-\text{O}-\text{CO}-\text{NR}_1-$, $-\text{CH}_2-\text{NR}_1-$, $-\text{CH}_2-\text{S}-$, $-\text{CH}_2-\text{SO}-$ and $-\text{CH}_2-\text{SO}_2-$ between the alpha carbon and the lipophilic group may be produced.

Alternatively the alcohol can be oxidized to form a corresponding aldehyde (e.g. by oxidation with manganese dioxide or DMSO/oxalyl chloride or DMSO/ SO_3 or Dess-Martin reagent) which may be reacted to introduce the lipophilic group by reactions such as:

reaction with Wittig reagents or Horner-Emmons reagents, optionally followed by reduction of the resulting carbon:carbon double bond using H_2/Pd -carbon;

20 reaction with an organometallic, eg a Grignard reagent, optionally followed by reaction on the resulting hydroxyl group, such as oxidation (eg with MnO_2 , DMSO/oxalyl chloride or Dess-Martin reagent),
25 alkylation (eg with an alkyl halide in the presence of a base in a solvent such as DMF), arylation (eg with diethylazo dicarboxylate/triphenyl phosphine and a hydroxyaryl compound), ester formation (eg with an acid chloride or with a carboxylic acid and diethylazido dicarboxylate/triphenyl phosphine), or carbamate
30 formation (eg with an isocyanate);

by reaction with an amine followed by reduction, e.g. with sodium cyanoborohydride;

by reaction with a hydrazine; or

35 by reaction with a carbazide.

In this way compounds with linkages of $-\text{CH}=\text{CR}_1-$, $-\text{CH}_2-\text{CHR}_1-$, $-\text{CHOH}-$, $-\text{CHR}_1-\text{O}-$, $-\text{CHR}_1-\text{O}-\text{CO}-$, $-\text{CHR}_1-\text{O}-\text{CO}-\text{NR}_1-$,

- 15 -

-CO-, -CH₂-NR₁-, -CH=N-NR₁- and -CH=N-NR₁-CO-NR₁- between the alpha carbon and the lipophilic group may be produced.

5 The transformation of alcohol to amine referred to above may be used to produce an amine reagent for lipophilic group introduction, e.g. a compound Bd-CONH-CH(Cy)-CH₂-NR₁H.

Such an amine reagent may be reacted to introduce the lipophilic group, e.g. by acylation with an acid
10 halide or activated ester, by reaction with isocyanate, by reaction with an isothiocyanate, or by reaction with a sulphonyl chloride. In this way compounds with linkages of -CH₂NR₁-CO-, -CH₂-NR₁-CO-NR₁-, -CH₂NR₁-CS-NR₁- and -CH₂NR₁-SO₂- between the alpha carbon and the
15 lipophilic groups may be produced.

The transformation of acid to amide referred to above may be used to produce an amide reagent for introduction of the lipophilic group, e.g. a compound
20 Bd-CONH-CH(Cy)-CON(R₁)₂.

Such amides may be reacted to introduce lipophilic groups, e.g. by reaction with a halo ketone (e.g. phenacyl bromide). This provides a linkage

from alpha carbon to lipophilic group.

Analogously the amide may be transformed to a
30 thioamide by reaction with Lawesson's reagent and then reacted with a halo ketone to form a linkage

35 The amide reagent may likewise be transformed to a nitrile reagent by dehydration, e.g. with trifluoroacetic anhydride. The nitrile reagent may be

- 16 -

reacted with hydrazine then with acyl halide and then cyclized, (e.g. with trifluoroacetic anhydride) to produce a linkage

5

Alternatively it may be treated with hydroxylamine then reacted with acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce a linkage

10

The hydrazide produced by reaction of a carboxylic acid reagent with hydrazine discussed above may likewise be used as a reagent for lipophilic group introduction, e.g. as a compound of formula $Bd-CONH-CH(Cy)-CO-NR_1-N(R_1)_2$.

Thus the hydrazide reagent can be reacted with an acyl halide and cyclized, e.g. with trifluoroacetic anhydride to yield a linkage

20

25

or reacted with an acyl halide or an isocyanate to yield linkages $-CO-NR_1-NR_1-CO-$ and $-CO-NR_1-NR_1-CO-NR_1-$ respectively.

Alternatively the hydrazide may be transformed by reaction with Lawesson's reagent and then reacted with an acyl halide and cyclized (e.g. with trifluoroacetic anhydride) to produce the linkage

35

- 17 -

An alternative route to these compounds is to carry out any of the above chemical reactions to incorporate the lipophilic group (an optional H bond donor) into a protected intermediate such as a compound of formula (IV).

PG = Protecting group

The protecting group may then be removed before coupling of the m-amidino benzoic acid (optionally protected).

A starting reagent for lipophilic group introduction where the alpha atom is nitrogen may be produced for example by reaction of a beta protected hydrazine (such protection to be chosen as to be compatible with the subsequent reagents to be employed) with phosgene, diphosgene, triphosgene or N,N'-carbonyl diimidazole to give a reactive compound of the type:

PG = Protecting group

This intermediate may be used as has been described above for the carboxylic starting reagents where the alpha atom is carbon.

Removal of the protecting group by standard methods and coupling with an activated m-carboxyl-benzamidine will give compounds of the type

- 18 -

(where Bd, X, Y, Cy, L, Lp and D are as defined above).

Thus viewed from a further aspect the invention provides a process for the preparation of a compound according to the invention which process comprises coupling a lipophilic group to a compound of formula (V)

(where Bd, X, Y and Cy are as defined above and Z is a reactive functional group), and optionally subsequently coupling a hydrogen bond donor group to said lipophilic group.

The compounds of the invention may be administered by any convenient route, e.g. into the gastrointestinal tract (e.g. rectally or orally), the nose, lungs, musculature or vasculature or transdermally. The compounds may be administered in any convenient administrative form, e.g. tablets, powders, capsules, solutions, dispersions, suspensions, syrups, sprays, suppositories, gels, emulsions, patches etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g. diluents, carriers, pH modifiers, sweeteners, bulking agents, and further active agents. Preferably the compositions will be sterile and in a solution or suspension form suitable for injection or infusion. Such compositions form a further aspect of the invention. Viewed from this aspect the invention provides a pharmaceutical composition comprising a serine protease inhibitor according to the invention together with at least one pharmaceutically acceptable carrier or excipient.

Viewed from a further aspect the invention provides the use of a serine protease inhibitor according to the invention for the manufacture of a medicament for use in a method of treatment of the human or non-human animal body (e.g. a mammalian, avian or reptilian body) to combat (i.e. treat or prevent) a condition responsive to

- 19 -

said inhibitor.

Viewed from a further aspect the invention provides a method of treatment of the human or non-human animal body (e.g. a mammalian, avian or reptilian body) to combat a condition responsive to a serine protease inhibitor (e.g. a condition such as a thrombotic disorder responsive to a factor Xa inhibitor), said method comprising administering to said body an effective amount of a serine protease inhibitor according to the invention.

The dosage of the inhibitor compound of the invention will depend upon the nature and severity of the condition being treated, the administration route and the size and species of the patient. However in general, quantities of from 0.01 to 100 $\mu\text{mol/kg}$ bodyweight will be administered.

All publications referred to herein are hereby incorporated by reference.

The invention will now be described further with reference to the following non-limiting Examples.

Experimental

Abbreviations used follow IUPAC-IUB nomenclature. Additional abbreviations are Hplc, high-performance liquid chromatography; DMF, dimethylformamide; DCM, dichloromethane; HOAt, 1-hydroxy-7-azabenzotriazole; HATU, [O-(7-azabenzotriazol-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate]; Fmoc, 9-Fluorenylmethoxycarbonyl; HOBt, 1-hydroxybenzotriazole; TBTU, 2-(1H-(benzotriazol-1-yl)-1,1,3,3-tetramethyluroniumtetrafluoroborate; DIPEA, diisopropylethylamine; Boc, tertiary butyloxycarbonyl; DIPCI, diisopropylcarbodiimide; DBU, 1,8-diazabicyclo[5.4.0]undec-7-ene; TEA, triethylamine; Rink linker, p-[(R,S)- α -[1-(9H-Fluoren-9-yl)methoxyformamido]-2,4-dimethoxybenzyl]phenyl acetic acid; TFA,

- 20 -

trifluoroacetic acid; MALDI-TOF, Matrix assisted laser desorption ionisation - time of flight mass spectrometry; and RT, retention time. Unless otherwise indicated, amino acid derivatives, resins and coupling reagents were obtained from Novabiochem (Nottingham, UK) and other solvents and reagents from Rathburn (Walkerburn, UK) or Aldrich (Gillingham, UK) and were used without further purification.

Purification: Purification was by gradient reverse phase Hplc on a Waters Deltaprep 4000 at a flow rate of 50 ml/min. using a Deltapak C18 radial compression column (40 mm x 210 mm, 10-15 mm particle size). Eluant A consisted of aqTFA (0.1%) and eluant B 90% MeCN in aqTFA(0.1%) with gradient elution (Gradient 1, 0 min. 20%B then 20% to 100% over 36 min., Gradient 2, 0 min. 5%B for 1 min. then 5%B to 20%B over 4 min., then 20% to 60% over 32 min. or Gradient 3, 0 min. 20%B then 20% to 100% over 15 min.). Fractions were analysed by analytical Hplc and MALDI-TOF before pooling those with >95% purity for lyophilisation.

Analysis: Analytical Hplc was on a Shimadzu LC6 gradient system equipped with an autosampler, a variable wavelength detector at flow rates of 0.4 ml/min. Eluents A and B as for preparative Hplc. Columns used were Techogell15 C18 (2x150mm) (Hplc Technology), Jupiter 5 C18 column (2.1x150 mm, 5µm particle size) (Phenomenex) and Kromasil C4 (2.0x150 mm, 5 mm) (HPLC Technology). Purified products were further analysed by MALDI-TOF and nmr.

All Fmoc-protected amino acids were purchased where available or prepared by known literature methods (1) with the exception of the following novel amino acid:

- 21 -

Preparation of (D,L)-N-Fluorenylmethoxycarbonyl-4-phenylphenylglycine.

A solution of 4-biphenylcarboxaldehyde (4.6g 25mmol),
5 sodium cyanide (3.68g 75mmol) and ammonium carbonate
(9.60g 100mmol) in 50% aqueous ethanol (175ml) was
heated at 50°C for 20 hours. The reaction mixture was
cooled, concentrated under reduced pressure and
acidified to pH 2.0 with concentrated hydrochloric acid
10 (fume hood). The intermediate 4-(4-phenylphenyl)-2,5-
imidazolidinedione was collected by filtration, washed
with dilute (0.5%) HCl and dried before using as crude
in the next stage. (Filtrates were retained and treated
with sodium hypochlorite solution before disposal)
15 The intermediate 4-(4-phenylphenyl)-2,5-imidazolidinedione
was refluxed in 16% aqueous sodium hydroxide (100ml, 16%
w/v) for 24h. The reaction mixture was then filtered,
cooled, diluted with water (100ml) and then shaken with
ethyl acetate and separated. The aqueous solution was
20 adjusted to pH 5.1 with concentrated hydrochloric acid
and the solid obtained collected by filtration, washed
with a little water and dried to give 4-
phenylphenylglycine (2.36g, 42%). ¹H nmr (d₆ DMSO)
consistent with desired product.
25 To a vigorously stirred solution of 4-
phenylphenylglycine (500mg 2.2mmol) in DCM (20ml) was
added DIPEA (614μl 4.4mmol) and then, carefully,
chlorotrimethylsilane (558μl 4.4mmol) and the mixture
refluxed for 1.5h. The reaction mixture was cooled in
30 an ice bath and fluorenylmethoxycarbonyl chloride (742mg
2.2mmol) was added in one portion. After stirring at 0°C
for 20min the ice bath was removed and stirring was
continued for 1.5h. The reaction mixture was
concentrated under reduced pressure and the residue
35 stirred with a mixture of diethyl ether (20ml) and
saturated sodium carbonate solution (30ml). A yellow
solid which failed to dissolve in either layer was taken

- 22 -

up in water (20ml) and acidified to pH 1 with dilute hydrochloric acid. The mixture was then extracted with ethyl acetate and the organic layer washed with water (2 x 20ml), dried with magnesium sulphate and evaporated to dryness. Recrystallisation from ethanol/water afforded (D,L)-N-fluorenylmethyloxycarbonyl-4-phenylphenylglycine (640mg, 65%).

¹H nmr (d₆ DMSO) 8.25 (1H, d, aromatics); 7.89 (2H, d, aromatics); 7.76 (2H d, aromatics); 7.67 (3H, d, aromatics); 7.57-7.25 (6H, m, aromatics); 5.23 (1H, d, -NH); ~4.27 (3H, m, H_α + CH₂).

Preparation of 3-Amidinobenzoic acid TFA salt

3 Cyanobenzoic acid (10g, 68 mmol) was refluxed in ethanol (300ml) on an isomantle fitted with reflux condenser and soxhlet extractor, the thimble being filled with A4 molecular sieve. Reflux was continued for 10 hours. The heating was then removed and the solution allowed to cool. The solution was then cooled in an ice bath and saturated with hydrogen chloride gas. The sealed flask was allowed to stand overnight then evaporated to dryness. To the dry product was added saturated ammonia/ethanol solution (400ml) and the flask sealed and allowed to stand overnight. The solution was then evaporated to dryness and then treated with 2M sodium hydroxide solution (3 eq., 102ml), the resulting solution was stirred for 2 hours then extracted with ethylacetate (100ml). The aqueous layer was then acidified, with 10% aq hydrochloric acid (200ml) in one lot and extracted with ethylacetate (100ml). Concentrated ammonia solution was added to pH 14 and the solution cooled in the fridge overnight. The precipitate formed was filtered off and washed with water, dissolved in 10%TFA water and lyophilised to a white powder (12g).

- 23 -

¹H nmr (D₂O) 8.40 (1H, s); 8.30 (1H, d, J=7.5Hz); 8.00 (1H, d, J=7.5Hz); 7.72 (1H, t).

Synthesis of inhibitors

5

Method 1: Using a solid phase strategy on a Protein Technologies, Symphony Multiple Peptide Synthesiser by attachment of bis amino compounds to Peg-2-chlorotrityl chloride resin: 2-Chlorotrityl chloride resin was typically treated with greater than 2 fold excess of the di-amine in dry DCM. The resin was further modified by the attachment of acids. Activation of Fmoc protected amino acid (2-5eq) was by TBTU/ DIPEA, all couplings (minimum 120 min.) were carried out in DMF. Deprotection of the Fmoc group was achieved with 20% (v/v) piperidine in DMF. Other acid substituents were added as the HOBt or HOAt esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min., ambient) with 10% (v/v) triethylsilane in TFA, filtration, evaporation and trituration with diethylether.

Synthesis using the Symphony Multiple Peptide Synthesiser.

The Symphony Multiple Peptide Synthesiser is charged with DMF, DCM, TBTU in DMF (450 mM), DIPEA in DMF (900 mM), 20% (v/v) piperidine in DMF. Resins are held in plastic reaction vessels that allow the introduction of reagents and solvents and nitrogen for agitation or air drying.

A typical synthesis cycle on the Symphony is as follows:-

- 24 -

The reaction vessel containing the resin (0.1 mmol) is charged with the Fmoc protected amino acid (0.5 mmol) and then this is dissolved in DMF (2.5ml), treated with TBTU (0.56 mmol, 1.25ml) and DIPEA (1.1 mmol, 1.25ml) and agitated with nitrogen for 2 hours (agitation times may vary). After coupling the resin is washed with DMF (6x 5ml) then deprotected with 20% (v/v) piperidine in DMF (2x 5ml for 1 min.each, then 1x 5ml for 8 min.) the resin is then washed with DMF (6x 5ml).

10

Example 1:**3-Amidino-benzoyl-D-phenylglycine 4-aminomethylcyclohexyl methylamide**

Bis-1,4 aminomethylcyclohexane(2ml) was added to 2 chlorotrityl chloride resin (1.2 mmol/g, 0.73g) pre swollen in dry DCM (4ml). After 2h the resin was washed with DCM (6x5ml), DMF (6x5ml) and DCM (6x5ml). The resin was then air dried to allow aliquots to be taken.

The bis-1,4-aminomethylcyclohexane 2-chlorotrityl chloride resin (0.1 mmol) was treated with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above.

HOBt (0.5 mmol, 68 mg) dissolved in DMF(4ml) at 0°C was treated with DIPCI (0.5 mmol, 80μl), for 10 min. 3-amidinobenzoic acid TFA salt (0.5 mmol, 139 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was transferred to the reaction vessel on the Symphony and agitated for 10 hours with nitrogen. The resin was washed with DMF (6x5ml), DCM (6x5ml) and air dried. The product was cleaved from the resin with 10% triethylsilane in TFA (10ml) for 30 minutes, the resin filtered off and the TFA solution evaporated to dryness and triturated with diethyl ether

- 25 -

to give the crude product. The crude product was dissolved in water (10ml), filtered and purified by preparative reverse phase Hplc.

5 **3-Amidino-benzoyl-D-phenylglycine 4-aminomethyl piperidinamide**

MS TOF 394 (M+1⁺). Hplc (Jupiter5 C18, Gradient 2, water/acetonitrile/TFA) rt 11.40 min. (major) and 11.97 min. (minor).

10

Method 2: By solid phase strategy on a Protein Technologies, Symphony Multiple Peptide Synthesiser using Fmoc amino acids attached to Peg-2-chlorotrityl chloride resin: Typically the 2-chlorotrityl chloride resin was treated with a 2 fold excess of the Fmoc amino acid in a 1:1 mixture of DMF and dry DCM and DIPEA (2eq.). The resin was washed with DMF/DCM and deprotected with 20% piperidine in DMF before further modification. The resin was further modified by the attachment of acids. Activation of Fmoc protected amino acids (2-5eq) was by activation with TBTU/ DIPEA, all couplings (minimum 120 min.) were carried out in DMF. Deprotection of the Fmoc group was achieved with 20% (v/v) piperidine in DMF. Other acid substituents were added as the HOBt or HOAt esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min., ambient) with 10% (v/v) triethylsilane in TFA, filtration, evaporation and trituration with ether.

30

Example 31.

3-Amidino-benzoyl-D-phenylglyciny-D-2-naphthylalaninyl-glycine

35

Fmoc Glycine (0.2mmol, 59 mg.) in DMF (2ml) was added to 2 chlorotrityl chloride resin (1.0 mmol/g, 0.1g) pre

- 33 -

swollen in dry DCM (2ml), then DIPEA (0.2 mmol). After 2h the resin was washed with DCM (6x5ml), DMF (6x5ml) and DCM (6x5ml). The resin was then air dried to allow aliquots to be taken for further modification.

5

On the Symphony Fmoc-Glycyl-2-chlorotrityl resin (0.1 mmol) was deprotected with 20% (v/v) piperidine in DMF and washed with DMF (6x 5ml) then treated with Fmoc-D-2-naphthylalanine (0.5 mmol 220 mg), DMF (2.5ml), TBTU in 10 DMF (1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above. The resin was then treated Fmoc-D-Phenylglycine (0.5 mmol 187 mg), DMF (2.5ml), TBTU in DMF (1.25ml of a 450mM 15 solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above. HOBt (0.5 mmol, 68 mg) dissolved in DMF (4ml) was stirred at 0°C with DIPCI (0.5 mmol, 80µl), for 10 min. 20 3-amidinobenzoic acid TFA salt (0.5 mmol, 139 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was transferred to the reaction vessel on the Symphony and agitated for 10 hours with nitrogen. The resin was then washed with DMF (6x5ml), 25 DCM (6x5ml) and air dried. The product was cleaved from the resin with 10% (v/v) triethylsilane in TFA (10ml) for 30 minutes, the resin filtered off, the TFA solution evaporated to dryness and triturated with diethyl ether to give the crude product. The crude product was then 30 dissolved in water (10ml), filtered and purified by preparative reverse phase Hplc..

¹H nmr (DMSO) δ 8.15 (1H, s); 8.12 (1H, d, J=7.5Hz); 7.85 (1H, d, J=7.5Hz); 7.74 (5H, m); 7.65 (1H, t); 7.42 - 35 7.25 (7H, m); 5.73 (1H, s); 4.72 (1H, m); 3.75 (2H, d); signals at 3.3-3.0 obscured by solvent. MS TOF 552 (M+1⁺). Hplc (Jupiter5 C18, Gradient 1, water/acetonitrile/TFA)

- 34 -

rt 14.88 min.

C18, Gradient 1, water/acetonitrile/TFA) rt 15.32 min.

25 **Method 3:** By solid phase strategy on a Protein
Technologies, Symphony Multiple Peptide Synthesiser
using Fmoc amino acids attached to TentaGel S- resin
(Rapp Polymere) via the Rink amide linker: Typically the
TentaGel resin was treated with a 5 fold excess of the
30 Rink linker, TBTU (1eq.), DIPEA (2eq.). The resin was
washed with DMF and deprotected with 20% piperidine in
DMF before further modification. The resin was further
modified by the attachment of acids. Activation of Fmoc
protected amino acid (2-5eq) was by TBTU/ DIPEA, all
35 couplings (minimum 120 min.) were carried out in DMF.
Deprotection of the Fmoc group was achieved with 20%
piperidine in DMF. Other acid substituents were added as

- 35 -

the HOBt or HOAt esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (30 min., ambient) with 10% triethylsilane in TFA, filtration, evaporation and trituration with ether.

Example 34.**3-Amidino-benzoyl-D-phenylglyciny1 D-phenylalanine amide**

On the Symphony TentaGel S -NH₂ resin (0.1 mmol, 400 mg, 0.24 mmol./g) was treated with Rink linker (0.5 mmol, 270mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above.

On the Symphony Rink-TentaGel resin (0.1 mmol) was then treated with Fmoc-D-Phenylalanine- (0.5 mmol, 194mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above.

The resin (0.1 mmol) was then treated with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as above.

HOBt (0.5 mmol, 68 mg) dissolved in DMF(4ml) was stirred at ice bath with DIPCI (0.5 mmol, 80 μ l) for 10 min. 3-amidino-benzoic acid TFA salt (0.5 mmol, 139 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was then transferred to the reaction vessel on the Symphony and agitated for 10 hours with nitrogen. The resin was then washed with DMF (6x5ml), DCM (6x5ml) and air dried. The product was

- 36 -

cleaved from the resin with 10% triethylsilane in TFA (10ml) for 30 minutes, the resin filtered off, the TFA solution evaporated to dryness and triturated with diethyl ether to give the crude product. The crude
5 product was then dissolved in water (10ml), filtered and purified by preparative reverse phase Hplc.

Example 55.

3-Amidino-benzoyl-D-phenylglyciny1-D-phenylalanine amide
MS 444 TOF ($M+1^+$). Hplc (Jupiter5 C18, Gradient 2,
water/acetonitrile/TFA) rt 14.82 min.

5

Example 56.

3-Amidino-benzoyl-D-phenylglyciny1-D-phenylalaninyl D-proline amide

MS TOF 541 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 2,
10 water/acetonitrile/TFA) rt 11.54 min.

Example 57.

3-Amidino-benzoyl-D-phenylglyciny1-D-tryptophan amide
MS TOF 483 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 2,
15 water/acetonitrile/TFA) rt 17.14 min.

Method 4: By solution phase strategy: Typically an activated Boc-amino acid was treated with an amine (primary or secondary) or alcohol (1eq.). Activation of
20 Boc protected amino acid was by HATU or TBTU/DIPEA(1:2), all couplings (minimum 120 min.) were carried out in DMF. After an aqueous work up the deprotection of the Boc group was achieved with TFA. Other acid substituents were added as the HOBt or HOAt
25 esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. The final products were purified by preparative reverse phase Hplc.

Example 58.

3-Amidino-benzoyl-D-phenylglycine -1-adamantylamide

Boc D-phenylglycine (251 mg, 1 mmol.) was dissolved in DMF(3ml) with HATU (380 mg., 1 mmol.) and DIPEA(350 μ l .,
35 2 mmol.). To this mixture was added 1-adamantylamine hydrochloride(187 mg., 1 mmol.) and DIPEA (170 μ l., 1 mmol.). The mixture was stirred overnight. The mixture

- 42 -

was then taken up into ethylacetate and washed with water, sodium carbonate solution, water, 10% hydrochloric acid solution and water. The ethylacetate was evaporated without drying and treated immediately with TFA for 30 min. The TFA was then evaporated to dryness and the product triturated with diethylether. TEA(1ml) was added and evaporated to dryness. HOBt (1 mmol, 136 mg) dissolved in DMF(4ml) was stirred at 0°C and treated with DIPCI (1 mmol, 160 μ l), for 10 min. 3 amidino benzoic acid TFA salt (1 mmol., 278 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was then added to the D-phenylglycine adamantyl amide and stirred overnight. The crude product was dissolved in water/acetonitrile (20ml), filtered and purified by preparative Hplc to yield pure product (150 mg.)

^1H nmr ($\text{D}_2\text{O}/\text{CD}_3\text{CN}$) 8.21 (1H, s); 8.13 (1H, d, $J=7.5\text{Hz}$); 7.92 (1H, d, $J=7.5\text{Hz}$); 7.70 (1H, t, $J=7.5\text{Hz}$); 7.46 (2H, m); 7.34 (3H, m); 5.52 (1H, s); 2.15-1.52 (15H, m). Example 68.**3-Amidino-benzoyl-D-phenylglycine-2adamantylamide**

MS TOF 431 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 12.68 min.

35

Method 5: By solid phase strategy using Boc amino acids

- 45 -

attached to Kaiser Oxime resin (Novabiochem): Typically the resin is treated with a 2 fold excess of the Boc phenylglycine symmetrical anhydride. The resin was washed with DCM/DMF then DCM and deprotected with 25%TFA in DCM before further modification. The resin was further modified by the attachment of acids. Activation of Boc protected amino acid (2-5eq) was by TBTU/ DIPEA, all couplings (minimum 120 min.) were carried out in DCM/DMF. Deprotection of the Boc group was achieved with 25%TFA in DCM. Other acid substituents were added as the HOBt or HOAt esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. Cleavage of the products from the resin was by treatment (1 day, ambient) with an amine or alcohol in chloroform, washing with chloroform and methanol/chloroform.

Example 69.**3-Amidino-benzoyl-D-phenylglycine cyclohexyl amide**

Boc-D-Phenylglycine (0.5 mmol, 126 mg) was dissolved in DCM (5ml) and treated with DIPCI (0.5 mmol., 80 μ l) and stirred for 10 min. A white precipitate forms which was dissolved by adding DMF. This mixture was added to Oxime resin (0.11 mmol, 330 mg, 0.33 mmol./g) previously swelled with DCM. 4-Dimethyl amino pyridine (10 mg, cat.) was added and the mixture swirled for 2 hours. The resin was filtered and washed with DMF/DCM then DCM. The resin was then treated with 25% TFA/DCM (20ml) for 20 min., filtered and washed with DCM. HOBt (0.5 mmol, 68 mg) dissolved in DMF(4ml) was stirred at 0°C with DIPCI (0.5 mmol, 80 μ l) for 10 min. 3 amidino-benzoic acid TFA salt (0.5 mmol, 139 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was then added to the phenylglycine-oxime resin and agitated for 2 hours. The resin was filtered washed with DMF, DCM and chloroform

- 46 -

then treated with cyclohexylamine (0.3 mmol, 40 μ l) in chloroform (2ml) and agitated for 1 day. The resin was then filtered off and washed with chloroform (10ml) and chloroform/methanol (1:1, 10ml). The combined organic
5 extracts were evaporated to dryness and washed with 10% aqueous acetic acid (5-10ml). The aqueous insoluble residue was dissolved in acetonitrile/water and lyophilised.

MS TOF 379 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3,
10 water/acetonitrile/TFA) rt 10.62 min.

Example 70.

3-Amidino-benzoyl-D-phenylglycine-3,3-dimethylbutylamide
MS TOF 382 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3,
15 water/acetonitrile/TFA) rt 13.90 min.

Example 71.

3-Amidino-benzoyl-D-phenylglycine-1,2,3,4-tetrahydro-1-naphthylamide
20 MS TOF 427 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 11.74 min.

Example 72.

3-Amidino-benzoyl-D-phenylglycine-R,S 3-methyl-2-butylamide
25 MS TOF 367 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 10.21 + 10.42 min.

Example 73.

3-Amidino-benzoyl-D-phenylglycine-3-phenylpropylamide
30 MS TOF 415 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 14.00 min.

Example 74.

3-Amidino-benzoyl-D-phenylglycine-3-trifluoromethyl benzylamide
35 MS TOF 455 ($M+1^+$). Hplc (Jupiter5 C18, Gradient 3,

- 47 -

water/acetonitrile/TFA) rt 14.32 min.

Example 75.

3-Amidino-benzoyl-D-phenylglycine-3-fluorobenzylamide

5 MS TOF 405 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 12.56 min.

Example 76.

3-Amidino-benzoyl-D-phenylglycine-2-methyl propylamide

10 MS TOF 353 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 11.10 min.

Example 77.

3-Amidino-benzoyl-D-phenylglycine-4-phenyl butylamide

15 MS TOF 429 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 14.96 min.

Example 78.

3-Amidino-benzoyl-D-phenylglycine-cyclohexylmethylethylamide

20 MS TOF 493 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 11.52 min.

Example 79.

3-Amidino-benzoyl-D-phenylglycine-2,2 diphenylethylamide

25 MS TOF 478 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 12.65 min.

Example 80.

3-Amidino-benzoyl-D-phenylglycine-R-1-(1-naphthyl)ethylamide

30 MS TOF 450 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 12.26 min.

Example 81.

3-Amidino-benzoyl-D-phenylglycine-S-1-(2-naphthyl)ethylamide

35 MS TOF 450 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,

- 48 -

water/acetonitrile/TFA) rt 11.19 min.

Method 6: By solution phase strategy: Typically an activated Fmoc amino acid was treated with an alcohol (1eq.) which contains a Boc protected amino group. Activation of Fmoc protected amino acid was by HATU or TBTU/ DIPEA(1:2), all couplings (minimum 120 min.) were carried out in DMF with DBU as catalyst After an aqueous work up the deprotection of the Fmoc group was achieved with 20% piperidine in DMF followed by evaporation and column chromatography. Other acid substituents were added as the HOBt or HOAt esters either by activation with HBTU/HATU or DIPCI with or without Boc protection of amino groups. The products were purified by preparative reverse phase Hplc, followed by deprotection of the amino groups with TFA. Further modification to acetamidine or amidine can be achieved by known literature methods.(2,3)

Example 82.

3-Amidino-benzoyl-D-phenylglycine -(4-piperidinyl)methyl ester

Fmoc D-Phenylglycine(1 mmol., 374 mg) was dissolved in DMF(5ml) with HATU (1 mmol., 380 mg) and DIPEA(2 mmol., 350 μ l). To this mixture was added N-Boc 4-hydroxymethyl piperidine (215 mg, 1 mmol.) and DBU (100 μ l). The mixture was stirred overnight. The mixture was then taken up into ethylacetate(50ml) and washed with water, sodium carbonate solution, water, 10% hydrochloric acid solution and water. The ethylacetate layer was dried over magnesium sulphate, filtered and evaporated. The product was then treated with 20% piperidine in DMF for 90 min. this was then evaporated to dryness and then dissolved in methanol and adsorbed onto silica gel 60. The material was then chromatographed on silica gel 60, eluting first with hexane/ethylacetate (2:1) then

- 49 -

hexane/ethylacetate (1:2), the required product eluting in the second solvent. The combined fractions were evaporated to dryness.

5 HOBt (1 mmol, 136 mg) dissolved in DMF(4ml) was stirred at 0°C with DIPCI (1 mmol, 160µl) for 10 min. 3 amidino-benzoic acid TFA salt (1 mmol., 278 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was then added to the D-phenylglycine N-Boc-4-piperidine methyl ester and 10 stirred overnight. The mixture was evaporated to dryness on high vacuum, water and acetonitrile added to allow full dissolution and the whole lyophilised. The resulting crude product was treated with TFA/water (9:1) for 30 min. and evaporated to dryness. The crude product 15 was dissolved in water/acetonitrile (20ml), filtered and purified by preparative reverse phase Hplc. Producing pure product (200mg).

Example 88.

2-Hydroxy-5-amidino-benzoyl D-phenylglycine-4-aminomethylcyclohexyl methylamide

5 5-Bromosalicylic acid (9.31mmol., 2.02g) was dissolved in DMF (4.5ml) and treated with copper (I) cyanide (11.33 mmol., 1.2eq., 1.015g) and heated under reflux for 4 hours. The solution was allowed to cool and poured
10 into a solution of ferric chloride (2g) and concentrated hydrochloric acid (0.7ml) in water (3ml). The mixture was heated for 10 min. at 60°C, then cooled and filtered, the solid was washed with water, then recrystallised ethanol/water. Product 0.73g, 48%.

15 On the Symphony bis-1,4-aminomethylcyclohexane 2 chlorotrityl chloride resin (0.1 mmol) (See method 1) was treated with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and
20 DIPEA in DMF (1.25ml of a 900 mM solution) and agitated with nitrogen for 2 hours. Deprotection and washing as above.

HOBt (0.5 mmol, 68 mg) dissolved in DMF(4ml) was stirred
25 at 0°C with DIPCI (0.5 mmol, 80µl) for 10 min. 2-hydroxy-5-cyanobenzoic acid (0.5 mmol, 84 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was then transferred to the reaction vessel on the Symphony and agitated for 10 hours with nitrogen.
30 The resin was washed with DMF (6x5ml), DCM (6x5ml) and air dried. The product was cleaved from the resin with 10% triethylsilane in TFA (10ml) for 30 minutes, the resin filtered off, the TFA solution evaporated to dryness and triturated with diethyl ether to give the
35 crude product. The crude product was dissolved in saturated hydrogen chloride in ethanol (10ml), sealed and allowed to stand overnight. The solution was

- 52 -

evaporated to dryness and treated with saturated ammonia in ethanol (10ml) and allowed to stand overnight. The solution was then evaporated to dryness, dissolved in water and purified by reverse phase Hplc.

10

Example 89.**2-Amino-5-amidinobenzoyl-D-phenylglycine-4-aminomethylcyclohexyl methylamide**

15

2-Amino-5-bromo benzoic acid (1.6 mmol., 345mg) was dissolved in N-methylpyrrolidone (5ml) and treated with copper (I) cyanide (2.39 mmol., 1.5eq., 207mg) under reflux for 4.5 hours. The solution was allowed to cool and poured into water (10ml). The mixture was acidified to pH3 with hydrochloric acid and extracted with ethylacetate, the ethylacetate was washed with water, dried over magnesium sulphate and evaporated to a yellow solid (145mg, 56%).

20

25

On the Symphony bis-1,4-aminomethylcyclohexane-2-chlorotrityl resin (0.1 mmol) (See method 1) was treated with Fmoc-D-Phenylglycine (0.5 mmol, 187 mg), DMF(2.5ml), TBTU in DMF(1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution) for 2 hours. Deprotection and washing as above.

30

HOBt (0.5 mmol, 68 mg) dissolved in DMF(4ml) was stirred at 0°C with DIPCI (0.5 mmol, 80μl) for 10 min. 2-amino-5-cyanobenzoic acid (0.5 mmol, 84 mg.) was added and stirring continued for 10 min. at room temperature. The mixture was transferred to the reaction vessel on the Symphony and agitated for 10 hours with nitrogen. The

35

- 53 -

resin was then washed with DMF (6x5ml), DCM (6x5ml) and air dried. The product was cleaved from the resin with 10% triethylsilane in TFA (10ml) for 30 minutes, the resin filtered off, the TFA solution evaporated to dryness and triturated with diethyl ether to give the crude product. The crude product was then dissolved in saturated hydrogen chloride in ethanol (10ml), sealed and allowed to stand overnight. The solution was then evaporated to dryness and treated with saturated ammonia in ethanol (10ml) and allowed to stand overnight. The solution was then evaporated to dryness, dissolved in water and purified by reverse phase Hplc.

25

Method 7

30

By solution phase strategy: Typically a Boc-amino alcohol with TEA is treated with an acid chloride to give an ester. Removal of the Boc protecting group with TFA followed by further extension of the compounds as in
Method 4.

35

- 66 -

Example 141.

{R}-{[N-(3-amidino)benzoyl]amino}-2-phenylethyl-4-(methoxy)benzoate.

5 To Boc-(D)-phenylglycinol (237mg, 1mmol, 1eq) and TEA(153μl, 1.1mmol, 1eq) dry DCM (5ml) was added p-anisoyl chloride (188mg, 1.1mmol, 1.1eq). The reaction was stirred overnight. Ethylacetate (30ml) was added and the organic layer was washed successively with 2 x
10 10ml of 10%HCl, NaHCO₃ solution, finally brine. Dried over magnesium sulphate, filtered and evaporated. to give the crude product (410mg). After treatment with TFA to remove the Boc group the compound were extended as in Method 4.

15

¹H nmr (DMSO) 8.25 (1H, s); 8.21 (1H, d); 7.95 (1H, d); 7.85 (2H,d); 7.75 (1H, t); 7.45 (5H, m); 7.05 (2H,d); 5.55 (1H, q); 4.55 (2H, d); 3.85 (3H, s). MS TOF 418 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
20 water/acetonitrile/TFA) rt 11.01 min.

By analogous methods the following were prepared

Example 142.

25 R-2-{[N-(3-amidino)benzoyl]amino}-2-phenylethyl-4-(methyl)benzoate

¹H nmr (DMSO) 8.25 (1H, s); 8.21 (1H, d); 7.95 (1H, d); 7.80 (2H,d); 7.75 (1H, t); 7.50 (2H,d); 7.34 (5H, m); 5.55 (1H, q); 4.55 (2H, d); 3.35 (3H, s). MS TOF 402
30 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 11.87 min.

¹H nmr (DMSO) 8.45 (1H, s); 8.40 (1H, d); 8.25 (2H,d); 8.15 (1H, d); 7.95 (1H, t); 7.65 (7H, m); 5.78 (1H, q);

- 67 -

4.84 (2H, d). MS TOF 472 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 12.85 min.

Method 8

5

By solution phase strategy: Typically a Boc-amino alcohol and a carboxylic acid are treated with (4-dimethylamino) phenyldiphenyl phosphine and diethylazodicarboxylate to give an ester. Removal of the Boc protecting group with TFA followed by further extension of the compounds as in Method 4.

Example 144.

{R}-{[N-(3-amidino)benzoyl]amino}-2-phenylethyl-4-(acetimido)benzoate

A dry solution of diethylazodicarboxylate (158μl, 1mmol, 1eq) in THF (5ml), was added dropwise to an anhydrous solution of (4-dimethylamino)phenyldiphenyl phosphine (306mg, 1eq, 1mmol), Boc-(D)-phenylglycinol (356mg, 1.5eq, 1mmol) and 4-acetimidobenzoic acid (179mg, 1mmol, 1eq) in THF (5ml) at -78°C. The reaction allowed to warm to room temperature and stirred overnight. Reaction monitored by t.l.c, SiO₂ / 75% ethylacetate in hexane indicating formation of product. R_f = 0.5. The solution was evaporated to remove THF and taken up into ethyl acetate(30ml) washed with 10% HCl solution, then brine. The solution was dried, filtered and evaporated to dryness. Crude yield ~650mg. Purification by column chromatography gave a yield of product of 200mg, (50%). After treatment with TFA to remove the Boc group the compound were extended as in Method 4.

¹H nmr (DMSO) 8.48 (1H, s); 8.54 (1H, d); 8.15 (1H, d); 8.05 (2H, d); 7.95 (3H, m); 7.75 (2H, m); 7.55 (3H, m); 5.70 (1H, m); 4.70 (2H, m); 2.27 (3H, s). MS TOF 445 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,

- 68 -

water/acetonitrile/TFA) rt 9.38 min.

Example 145.

R-2-{[N-(3-amidino)benzoyl]amino}-2-phenylethyl-4-(methylsulphonyl)benzoate

¹H nmr (DMSO) 8.25 (1H, s); 8.21 (1H, d); 8.10 (4H, q); 7.95 (1H, d); 7.75 (1H, t); 7.45 (5H, m); 5.60 (1H, q); 4.65 (2H, d); 2.08 (3H, s). MS TOF 466 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 9.75 min.

Example 146.

R-2-{[N-(3-amidino)benzoyl]amino}-2-phenylethyl-4-acetylbenzoate

¹H nmr (DMSO) 8.03 (1H, s); 8.00 (1H, d); 7.83 (4H, m); 7.73 (1H, d); 7.53 (1H, t); 7.25 (5H, m); 5.38 (1H, q); 4.41 (2H, d); 2.42 (3H, s). MS TOF 430 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 10.46 min.

Method 9

By solution phase strategy: Typically an activated Boc-amino acid was converted to the amide with ammonia and then to the thioamide using Lawessons reagent. Reaction of the thioamide with an acyl bromide to give a Boc protected thiazole. Deprotection of the thiazole with TFA allows further extension of the compound as in Method 4.

Example 147.

2-[(N-3-amidinobenzamido)-1-phenyl]methyl-4-phenylthiazole

To a solution of Boc-D-phenylglycine (875mg 3.5mmole) in a 1:1 mixture of DMF and DCM (40ml) was added 1-hydroxybenzotriazole (520mg 1.1equiv.) and DIPCI (602ml

- 69 -

1.1equiv.) and the mixture stirred for 30min at rt. Ammonia gas was bubbled in and the mixture left overnight before diluting with ethyl acetate and washing with 10% hydrochloric acid and sat. sodium bicarbonate.

5 The organic solution was dried (magnesium sulphate) and evaporated. Flash chromatography (silica gel DCM/ethylacetate 0-50%) gave the amide 770mg 86%. To a solution of Boc-D-phenylglycine amide (740mg 2.96mmole) in THF 25ml was added Lawesson's reagent

10 (1.2g) and the mixture stirred overnight. The solvent was evaporated off under reduced pressure and the residue purified by flash chromatography (silica gel - hexane/ethyl acetate 10 to 30%) to give the thioamide 671mg.

15 The thioamide (650mg) was dissolved in acetone (20ml) and phenacyl bromide (486mg 1 equiv) stirred for 30min and then diluted with chloroform/aqueous sod. bicarbonate (20ml each), separated, dried (magnesium sulphate) and evaporated. The residue was dissolved in

20 DCM (20ml) and treated with pyridine (350ml) and trifluoroacetic anhydride (360ml). After 150min the solvent was removed under reduced pressure and the residues redissolved in DCM and washed with sat. sod. bicarbonate. Purification by flash chromatography

25 (silica gel - hexane/ethyl acetate 10 to 30%) gave the thiazole intermediate 687mg. Deprotection of the amine was carried out using 50% TFA in DCM (30min), evaporation of solvent under reduced pressure, dissolving in DCM, washing with sat sod.

30 bicarbonate, drying (magnesium sulphate) and evaporation. Coupling of the thiazole intermediate to 3-amidino benzoic acid was carried out using the standard method Method 4 to give 2-[(N-3-amidinobenzamido)-1-

35 phenyl]methyl-4-phenylthiazole TFA salt.

TOF 413 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
water/acetonitrile/TFA) rt 11.8 min.

5

Method 10

By solution phase: Typically a compound prepared as
Method 4 is further reacted with ethyl chloroformate to
10 give the 3-Ethoxycarbonyl amidino compound

Example 148.

**3-(Ethoxycarbonyl)-amidinobenzoyl-D-phenylglycine-4-
methylbenzyl amide.**

15

To a solution of 3-Amidinobenzoyl-(D)-phenylglycine-4-
methylbenzyl amide (125mg, 0.31mmole) in DCM (20ml) was
added DIPEA (163ml 0.94mmole) and then over 2min. ethyl
chloroformate 33ml 0.34mmole). The reaction was stirred
20 overnight and the solvent removed under reduced
pressure. The residue was dissolved in ethylacetate and
washed with water (x3), dried (magnesium sulphate) and
evaporated to dryness. Flash chromatography (silica gel,
DCM/Ethylacetate 0-100%) gave the title compound 98mg

25

Method 11

By solution phase strategy: Typically 3-cyanobenzoic acid is activated with carbonyl-diimidazole and reacted with R-phenylglycinol to give 3-cyanobenzoylphenylglycinol. Reaction with a trichloroacetimidate and BF₃ etherate, (4), gives an ether. Reaction of the cyano group with HCl in ethanol followed by ammonia in ethanol gives the amidino compound.

Example 150.**3-Amidinobenzoyl-2-(4-methylbenzyloxy)-1-phenylethylamide**

3-Cyanobenzoic acid was condensed with (R)-phenylglycinol using N,N'-carbonyl-diimidazole as activator to give 3-cyanobenzoylphenylglycinol. ¹HNMR (CDCl₃) 8.05 (2H, d); 7.55 (1H, t); 7.4 (8H, m); 5.17 (2H, bs); 4.50 (2H, bs).

3-Cyanobenzoylphenylglycinol in 1:1 DCM: cyclohexanol (50ml) was treated with 4-methylbenzyl trichloroacetimidate and BF₃ etherate and the crude product purified by flash chromatography to give 3-cyanobenzoyl-2-(4-methylbenzyloxy)-1-phenylethylamide which was then taken up in ethanol and saturated with HCl gas and left overnight at room temperature. The solvent and excess HCl gas were removed under reduced

- 72 -

pressure and the residue redissolved in ethanol and the solution saturated with ammonia gas and left overnight. The solvent and excess ammonia were removed under reduced pressure and the residue treated with aqueous acetonitrile and trifluoroacetic acid. Preparative hplc gave the title compound approx 80% pure by hplc.

¹HNMR (d₆DMSO) 9.1 (5H, bs+d); 8.22 (2H, s+d); 7.90 (1H, d); 7.74 (1H, t); 7.35 (5H, m); 7.10 (4H, Abq); 5.35 (1H, q); 4.50 (2H, s); 3.70 (2H, m); 2.25 (3H, s). MS TOF 389 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 11.79 min.

Miscellaneous Examples

Example 151.

N-(3-Amidinobenzoyl)-2-amino-2(R)-phenylethoxycarbonyl-4-methylaniline

To a solution of Boc-(R)-phenylglycinol (500mg 3.65mmole) in DMF (20ml) was added 4-methylphenylisocyanate (500ml 4.0mmole) and the mixture warmed to 50°C before standing at room temperature overnight. Dilution with ethyl acetate and washing with sat. sodium bicarbonate gave after drying (magnesium sulphate) and evaporation of solvent the crude intermediate which was purified by flash chromatography (silica gel, EtOAc 0-20% in DCM) Deprotection of the amine was carried out using 50% TFA in DCM (30min), evaporation of solvent under reduced pressure, dissolving in DCM, washing with sat sod. bicarbonate, drying (magnesium sulphate) and evaporation. Coupling of the thiazole intermediate to m-benzamidine was carried out using the standard method 4 to give N-(3-Amidinobenzoyl)-2-amino-2(R)-phenylethoxycarbonyl-4-methylaniline.

- 73 -

¹H NMR (d₆DMSO) 8.2 (2H, m); 7.90 (1H, d); 7.72 (1H, t); 7.44 (2H, d); 7.35 (5H, m); 7.08 (2H, d); 5.35 (1H, m); 4.33 (2H, m); 2.25 (3H, s). MS TOF 417 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 11.54 min.

Example 152.**3-Amidinobenzyl-D-phenylglycine-cis/trans-4-aminomethyl cyclohexylmethyleamide**

10

Bis-1,4-aminomethylcyclohexane 2-chlorotrityl resin (0.2 mmol) (as prepared by method 1) was treated with Fmoc-D-Phenylglycine (0.5 mmol, 187mg), DMF (2.5ml), TBTU in DMF (1.25ml of a 450mM solution) and DIPEA in DMF (1.25ml of a 900 mM solution). The mixture was agitated with nitrogen for 2 hours. Deprotection and washing as in method 1. The resin was then treated with 3-cyanobenzaldehyde (0.5mmol, 66mg) in DMF agitated overnight. The resin was washed with DMF then with Dry THF to remove all DMF. Sodium cyanoborohydride (1mmol, 63mg) in THF and acetic acid (100μl) was then added to the resin and agitated for 4 hours. The resin was then washed with THF, the DMF and finally DCM. The resin was then treated with TFA containing 5% TES for 30 mins. The resin was then filtered off and the TFA evaporated then held under high vacuum to dry the product. The product was then taken up into saturated hydrogen chloride gas in ethanol (20ml.) overnight. The ethanol was then evaporated and the product treated with saturated ammonia gas in ethanol (20ml.) overnight. The ethanol was then evaporated and the product purified by preparative hplc.

¹H nmr (CD₃CN) Mixture of cyclohexyl cis and trans isomers 7.85 (2H, m); 7.79 (1H, d); 7.66 (1H, t); 7.50 (5H, m); 4.97 (1H, s); 4.22 (2H, s); 3.00 (2H, m); 2.78 (2H, m); 1.48 (7H, m); 0.86 (3H, m) MS TOF 407 (M+1⁺).

rt 9.78 min.

Example 153.**5 4-Methylphenylacetyl-L-phenylglycine-3-amidino anilide**

Boc-L-phenylglycine (0.6mmol, 150mg), HATU (0.6mmol, 230mg) and DIPEA (1.2mmol., 220 μ l) were dissolved in DMF (5ml) and stirred for 15mins. 3-Aminobenzonitrile (0.6mmol., 70mg) was added and the mixture stirred overnight. The DMF was then evaporated and the mixture taken into ethylacetate (50ml) and washed with water, sodium carbonate solution, water 10% hydrochloric acid and water. The ethylacetate was evaporated to give the product Boc-L-phenylglycine-3-cyano anilide. The product was treated with TFA (50ml) for 30mins. The TFA was evaporated to dryness. m-Tolylacetic acid (0.7mmol., 100mg), HATU (0.7mmol., 250mg) and DIPEA (1.4mmol., 250 μ l) were dissolved in DMF (5ml) and stirred for 15mins. This was then added to the above product with DIPEA (0.6mmol., 110 μ l) and stirred overnight. The DMF was evaporated and the mixture taken into ethylacetate (50ml) and washed as above. The ethyl acetate was then evaporated and the product treated with hydrogen chloride gas in ethanol and ammonia gas in ethanol as above. The product was purified by preparative hplc.

Compounds synthesised by Method 12

25

Example 178.

R-2-{[N-(3-Amidino)benzoyl]amino}-2-phenylethyl-4-methoxybenzamide

30 Typically Boc-(R)-1,2-diamino-1-phenylethane was prepared by the Method of O'Brien, P. et al. *J. Med. Chem.* 37 (1994) 12, 1810-1822. The free amino group was reacted with an acid chloride or an activated acid, all couplings (minimum 120 min.) were carried out in DMF.
35 After an aqueous work up the deprotection of the Boc group was achieved with TFA. Other acid substituents were added as the HOBt or HOAt esters either by

- 82 -

activation with HBTU/HATU, EDC or DIPCI with or without Boc protection of amino groups. The final products were purified by preparative reverse phase Hplc.

5 Boc-(R)-1,2 diamino-1-phenylethane (2g) was dissolved in DCM (80ml) and toluoylchloride (1.2ml.) and TEA (1.1ml.) added. The mixture was stirred at room temperature under argon overnight. The mixture was then washed with 2M
10 sodium hydroxide solution, water, 5% hydrochloric acid and brine, dried over magnesium sulphate, filtered and evaporated. The product was recrystallised from hexane dissolved in DCM (50ml.) and treated with TFA for 2hrs. The solvent was evaporated and the solid triturated with diethylether. Coupling to m-benzamidine as Method 4.

15 ¹H nmr (DMSO) 8.25 (1H, s); 8.20 (1H,d); 7.95 (1H, d); 7.75 (3H,m); 7.35 (5H, m); 6.90 (2H,d); 5.35 (1H, m); 3.80 (3H,s); 3.70 (2H,m). MS TOF 417 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt
20 10.31 min.

Example 179.

R-2-{[N-(3-Amidino)benzoyl]amino}-2-phenylethyl-4-methylbenzamide

25 ¹H nmr (CD₃CN) 8.05 (1H, s); 8.00 (1H,d); 7.85 (1H, d); 7.65 (1H, t); 7.55 (2H,d); 7.35 (5H, m); 7.20 (2H,d); 5.30 (1H, m); 3.75 (2H,m); 2.30 (3H,s); MS TOF 401 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3,
30 water/acetonitrile/TFA) rt 10.58 min.

Compounds synthesised by Miscellaneous Methods

Example 180.

3-Amidino-benzoyl-DL-(4-methoxycarbonyl)phenylglycine-4-methylbenzylamine

D,L-4-Carboxyphenylglycine was prepared from 4-cyanobenzaldehyde by a method described by Clark, B. P. et al *Biorganic & Medicinal Chemistry Letters*, 1997, 7, 2777-2780.

D,L-4-Carboxyphenylglycine (600mg.) was suspended in methanol (30ml) at 0°C, saturated with hydrogen chloride gas and left at room temperature overnight. The reaction mixture was then evaporated to dryness under reduced pressure, resuspended in methanol and evaporated twice more and the solid triturated with ether, filtered and dried to give D,L-4-methoxycarbonylphenylglycine methyl ester HCl salt 620mg.

D,L-4-methoxycarbonylphenylglycine methyl ester HCl salt (600mg) was reacted with di-t-butyl dicarbonate in dioxane/ aqueous sodium bicarbonate to give after extraction with ethyl acetate and flash chromatography (SiO₂ hexane/ethyl acetate) - D,L-Boc-4-methoxycarbonylphenylglycine methyl ester 590mg. - ¹H nmr (CDCl₃) 7.78 (2H, d); 7.20 (2H, d); 5.61 (1H, broad d); 5.13 (1H, broad d); 3.63 (3H, s); 3.44 (3H, s); 1.16 (9H, s).

D,L-Boc-4-methoxycarbonylphenylglycine methyl ester (400mg) was dissolved in THF 10ml and treated with a solution of lithium hydroxide monohydrate 64mg. in water 1ml and the mixture stirred at room temperature for 30min. The reaction mixture was acidified with 2M hydrochloric acid, extracted with ethyl acetate and the organic solution was washed twice with water and dried

- 84 -

(MgSO₄). Evaporation of the solvent and purification by flash chromatography gave D,L-Boc-4-methoxycarbonyl-phenylglycine 282mg. ¹H nmr (CDCl₃) 8.0 (1H, broad d); 7.78 (2H, d); 7.20 (2H, d); 5.13 (1H, broad d); 3.80 (3H, s); 1.13 (9H, s).

D,L-Boc-4-methoxycarbonylphenylglycine was coupled to 4-methylphenyl-benzylamine using TBTU/DIPEA/DMF in the usual manner to give D,L-(4-methoxycarbonyl)phenylglycine-4-methylphenylbenzylamide. ¹H nmr (CDCl₃) 7.93 (2H, d); 7.35 (2H, d); 7.02 (2H, d); 6.93 (2H, d); 5.78 (2H, m); 5.08 (1H, broad s); 4.30 (2H, m); 3.86 (3H, s); 2.22 (3H, s); 1.30 (9H, s).

D,L-(4-methoxycarbonyl)phenylglycine-4-methylphenylbenzyl amide was deprotected using TFA/DCM and coupled to m-benzamidino carboxylic acid TFA salt as Method 4. ¹H nmr (DMSO) 8.40 (1H, s); 8.30 (1H, d); 8.10 (3H, m); 7.80 (3H, m); 7.20 (4H, s); 6.00 (1H, s); 4.35 (2H, s); 4.00 (3H, s); 2.40 (3H, s);. MS TOF 459 (M+1⁺). Hplc (Jupiter5 C18, Gradient 1, water/acetonitrile/TFA) rt 10.88 min.

25

Example 181.**3-(Trimethylacetyloxomethylcarbonylamidino)-benzoyl-D-phenylglycine-4-(4-chlorophenyl)piperazinamide**

Trimethylacetyloxymethyl carbonochloridate was prepared by the Method described by Folkmann and Lund, *Synthesis*, 1990, 1159., and reacted with 3-amidino-benzoyl-D-phenylglycine-4-(4'-chlorophenyl)piperazinamide (Example 116) in acetonitrile/aqueous sodium bicarbonate to give, after flash chromatography (SiO₂ - DCM/ethylacetate) trimethylacetyloxymethylcarbonyl-3-amidino-benzoyl-D-phenylglycine-4-(4'-chlorophenyl)piperazinamide.

- 85 -

¹H nmr (DMSO) 8.35 (1H, s); 8.10 (1H, d); 8.00 (1H, d); 7.60 (1H, t); 7.55 (2H, m); 7.40 (3H, m); 7.20 (2H, d); 6.80 (2H, d); 6.05 (1H, s); 5.75 (2H, s); 3.75 (1H, m); 3.65 (2H, m); 3.45 (3H, m); 3.30 (1H, m); 2.85 (1H, m) 1.20 (9H, s). MS TOF no (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 13.30 min.

Example 182.

R-3-Amidino-{2-(4-benzylpiperidin-1-yl)}-1-phenylethyl benzamide

Boc-D-Phenylglycine-OH was coupled to 4-benzylpiperidine as Method 4 and the Boc group removed with TFA. The product was dissolved in dry THF and added dropwise to LiAlH₄ (1.2eq) suspended in dry THF (15ml) under nitrogen and refluxed under nitrogen for 20 hours. On cooling the reaction was carefully diluted with water, acidified to pH 1 (HCl), and washed with EtOAc. The aqueous solution was basified to pH 10 (solid Na₂CO₃), then extracted with EtOAc to obtain product which was further elaborated as Method 4.

5

Example 186.

(R)-O-(3-Amidinobenzyl)-N-(4-methylbenzyl)mandelamide
(R)-O-(3-Cyanobenzyl) mandelic acid

10 (R)-Mandelic acid 91g, 6.57mmol.) was dissolved in THF
(15ml.) and treated portionwise with sodium hydride
(60%w/w, 0.798g, 19.7mmol.). The white suspension was
heated at reflux and treated dropwise with 3-
15 cyanobenzylbromide (1.93g, 9.86mmol.) in THF (20ml.)
over 5mins. The mixture was refluxed for 2 days. The
reaction mixture was cooled and treated with water
(100ml.). The aqueous phase was washed with diethyl
ether then acidified to pH 1 with 10% HCl solution. The
product was extracted with ethyl acetate. The extracts
20 were washed with brine and dried over magnesium
sulphate, filtered and evaporated to give the product
(1.5g) as a gum.

¹H nmr (CD₃OD) 7.70 (3H, m); 7.40 (6H, m); 5.00 (1H, s);
25 4.65 (2H, m).

(R)-O-(3-Cyanobenzyl)-N-(4-methylbenzyl)mandelamide

HOAt (0.27g, 1.96mmol.) and DBU (0.3g, 1.96mmol.) was
30 dissolved in DMF (8ml.) and cooled in ice. EDC (0.38g,
1.96mmol.) was added in 3 portions and stirred for
10mins.. To this mixture was added (R)-O-(3-Cyanobenzyl)
mandelic acid (0.5g, 1.87mmol.) in DMF (2ml.) and the
mixture allowed to warm to room temperature for 5 mins.
35 4-Methylbenzylamine (0.23g, 1.96mmol.) was then added in
one portion. The mixture was stirred for 1 hr. The
reaction was quenched with water (100ml.) and basified

- 88 -

with 2M sodium hydroxide solution. The product was extracted with ethylacetate. The combined extracts were washed with dilute (5%) lithium bromide solution, water and brine, dried over magnesium sulphate, filtered and evaporated to give a gum (0.58g). The crude product was chromatographed on silica gel eluting with 35% ethylacetate in hexane.

¹H nmr (CDCl₃) 7.50 (2H,m); 7.30 (6H,m); 7.05 (4H,s); 6.90 (1H,m); 4.80 (1H,s); 4.55 (2H,m) 4.35 (2H,s); 2.25 (3H,s).

(R)-O-(3-Amidinobenzyl)-N-(4-methylbenzyl)mandelamide

(R)-O-(3-Cyanobenzyl)-N-(4-methylbenzyl)mandelamide (0.16g) was dissolved in ethanol (10ml) and treated with hydrogen chloride gas for 30 mins. The mixture was then stirred overnight at room temperature, evaporated to dryness and dissolved again in ethanol (10ml.). The mixture was treated with ammonia gas for 5 mins. and allowed to stand overnight. The mixture was evaporated and the product purified by preparative hplc.

¹H nmr (CDCl₃) 7.65 (1H,s); 7.50 (1H,d); 7.30 (7H,m); 7.00 (4H,s); 4.80 (1H,s); 4.55 (2H,m) 4.35 (2H,s); 2.25 (3H,s). MS TOF 387 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 11.24 min.

Example 187.

2-(3-Amidinobenzoyl)-1-(3-phenylpropanoyl)-1-phenylhydrazine.

1-(3-phenylpropanoyl)-1-phenylhydrazine

2-tert Butoxycarbonyl-1-phenylhydrazine (1.3g) was dissolved in pyridine (6ml.) and treated with 3-phenylpropanoyl chloride (0.75ml.). The mixture was stirred overnight at room temperature under argon. The pyridine was then removed by evaporation and the residue

- 89 -

taken up in ethyl acetate and washed with 10% hydrochloric acid, saturated sodium carbonate solution and brine. The ethyl acetate fraction was dried over magnesium sulphate, filtered and evaporated. The crude product was chromatographed on silica eluting 5-25% ethyl acetate in hexane. The purified product was dissolved in DCM and treated with TFA before coupling to m-benzamidine by Method 4.

¹H nmr (CD₃OD) 8.20 (1H, s); 8.05 (1H, d); 7.90 (1H, d); 7.65 (1H, t); 7.35 (5H, m); 7.10 (5H, m); 6.15 (1H, s); 2.60 (4H, m). MS TOF 388 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 10.75 min.

Example 188.

3-{[R]-N-(3-Amidinobenzamido)-1-phenyl}methyl-5-benzyl-1,2,4-triazole.

EDC (1.6g) was dissolved in DMF (20ml.) and treated with HOAt (1.16g) in DMF (10ml.) and stirred for 10 mins. DIPEA (1.46ml.) was then added and the stirring continued for a further 15 mins. Boc-D-phenylglycine (2g) in DMF (10ml.) was then added dropwise and stirring continued for a further 25mins. 1M Hydrazine in THF (84ml.) was then added and the mixture stirred over night. The solvents were then evaporated and the residue treated with water (100ml.), basified with 2M sodium hydroxide solution and extracted with ethyl acetate. The combined extracts were washed with water and brine, dried with magnesium sulphate, filtered and evaporated to give a yellow solid (1.38g).

¹H nmr (CDCl₃) 7.20 (5H, s); 5.55 (1H, s); 1.25 (9H, s).

The above product (0.3g, 1.13mmol.) was dissolved in ethanol (6ml.) and added dropwise to a solution of benzyl ethyl imidate hydrochloride in ethanol (3ml.) at

- 90 -

room temperature. The mixture was stirred for 30 mins. The solvent was then evaporated and the residue treated with dilute sodium bicarbonate solution and extracted with ethylacetate. The combined extracts were washed
5 with brine, dried over magnesium sulphate, filtered and evaporated to give a yellow gum. (0.43g).

¹H nmr (CDCl₃) 7.30 (10H,m); 5.80 (1H,s); 3.50 (2H,m);
1.45 (9H,s).

10

The above crude product (0.43g, 1.12 mmol.) was dissolved in xylene (60ml.) with para toluenesulphonic acid (cat.) and heated to 160°C for 1 day. The xylene was removed under vacuo and the triazole (0.35g) used
15 without further purification.

¹H nmr (CDCl₃) 7.20 (10H,m); 5.70 (1H,s); 4.00 (2H,m);
1.30 (9H,s).

20 The above product was treated with TFA and coupled to m-benzamidine by Method 4

¹H nmr (CD₃OD) 8.20 (1H,s); 8.05 (1H,d); 7.80 (1H,d);
7.60 (1H,t); 7.20 (10H,m); 6.50 (1H,s); 4.10 (2H,s).

25 MS TOF 411 (M+1⁺). Hplc (Jupiter5 C18, Gradient 3, water/acetonitrile/TFA) rt 14.38 min.

Assay protocols

Enzyme Inhibition assays:

10

Enzyme assays were carried out at room temperature in 0.1M phosphate buffer, pH7.4 according to the method of Tapparelli et al (*J. Biol. Chem.* 1993, 268, 4734-4741). Purified human factor Xa, trypsin, thrombin and plasmin were purchased from Alexis Corporation, Nottingham, UK. Urokinase was purchased from Calbiochem, Nottingham, UK. Chromogenic substrates for these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH, pefachrome-PL and pefachrome-UK were purchased from Pentapharm AG, Basel, Switzerland. Product (*p*-nitroaniline) was quantified by adsorption at 405nm in 96 well microplates using a Dynatech MR5000 reader (Dynex Ltd, Billingshurst, UK). K_m and K_i were calculated using SAS PROC NLIN (SAS Institute, Cary, NC, USA, Release 6.11) K_m values were determined as 100.9 μ M for factor Xa/pefachrome-FXA and 81.6 μ M for trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500 μ M, 50 μ M and 5 μ M. Accuracy of K_i measurements was confirmed by comparison with K_i values of known inhibitors of factor Xa and trypsin.

In agreement with published data, benzamidine inhibited factor Xa, trypsin, thrombin, plasmin and urokinase with K_i values of 155 μ M, 21 μ M, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a K_i value of 3nM. Compounds of the invention were found to have activity in these assays.

Antithrombotic Activity

The test material (Factor Xa inhibitor) was administered either intravenously, intraperitoneally or orally to a group of rats for experiment. A second group received vehicle (saline) only as a control, and a third group of animals received a standard antithrombotic (subcutaneous lmw heparin) as a positive control.

10

To perform the experiment male Sprague-Dawley rats (250-400g in weight) were anaesthetised by the inhalation of isoflurane with the addition of oxygen and nitrous oxide. The left or right femoral vein was carefully exposed and isolated from the femoral artery and saphenous nerve. Following removal of connective tissue a cannula containing physiological saline was inserted into the femoral vein.

15

A segment of each of the left and right jugular vein was exposed and separated from the surrounding connective tissue. Each segment consisted of the section of vein between the exit point from the thorax to the vessel's first major junction.

25

At the desired interval following the administration of the test material or vehicle a bolus injection of 'deactivated' human serum (1.32 ml.kg^{-1}) was administered over less than 30 seconds, via the femoral vein cannula. Two minutes following the thrombus challenge both the jugular vein segments were ligatured at both ends and left *in situ* for thrombi to form.

30

After 10 min both jugular segments were carefully excised, and placed in a petri dish containing 0.9% saline. A blood sample (1.8 ml blood + 0.2 ml 3.8% sodium citrate) was obtained by cardiac puncture and the animal sacrificed by an overdose of Expiral (sodium

35

pentobarbitone) administered intravenously via the femoral vein cannula or by cardiac puncture. The 2 segments of jugular vein were carefully dissected longitudinally along one surface to expose the lumen and dispel the vessel contents into the saline. The tissues were examined for the presence of any developed thrombi and scored accordingly.

Thrombus score:

10

- 0 = No thrombus
- 1 = One or several small thrombi
- 2 = Several larger thrombi
- 3 = Large thrombus occluding the vessel

15

Compounds of the invention were found to have significant antithrombotic activity in these assays.

Partial Thromboplastin Time Test Protocol

20

Venous blood was collected into 3.2% (0.109M) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood.

25 The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma, which was frozen at 70°C until required.

30 To perform the test, 100 μ l of plasma was pipetted into in a glass test tube, 1 μ l of test compound in DMSO was added, and allowed to warm to 37° over two minutes.

100 μ l of warm (37°) Manchester (tissue thromboplasin) reagent (Helena Biosciences, UK) was added, allowed to equilibrate for sixty seconds.

35

100 μ l of warm (37°) 25mM calcium chloride solution was added to initiate clotting.

The test tube was tilted three times through a 90° angle every five seconds to mix the reagents and the time to clot formation recorded.

- 5 Data from a series of observations and test compound concentrations are analysed by a SAS statistical analysis program and a CT2 (Concentration required to double clotting time) for each compound is generated.
- 10 Compounds of the invention were found to significantly elongate the partial thromboplastin time.

Kaolin Activated Partial Thromboplastin Time Test Protocol

- 15 Venous blood was collected into 3.2% (0.109m) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood.

- 20 The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma, which was frozen at 70°C until required.

- 25 To perform the test, 100µl of plasma was pipetted into in a glass test tube, 1µl of test compound in DMSO was added, and allowed to warm to 37° over two minutes.

- 30 100µl of APTT reagent resuspended in Owren's buffer (Thrombosis Reference Centre University of Manchester, Withington Hospital, Manchester) was added, mixed thoroughly, and 100µl of prewarmed kaolin suspension in Owren's buffer added.

- 35 This mixture was incubated for ten minutes at 37°, with regular gentle mixing by tilting through a 90° angle, three times sequentially at one minute intervals to maintain the kaolin in suspension.

- 95 -

ten minutes 100 μ l of 25mM calcium chloride
ion was added, the suspension redispersed by
ng as above and the time to clot formation
orded.

from a series of observations and test compound
ntrations are analysed by a SAS statistical
is program and a CT2 (Concentration required to
clotting time) for each compound is generated.

Claims

1. A serine protease inhibitor compound of formula I

5

10

15

(where R_1 and R_2 each independently is hydrogen or hydroxyl, alkoxy, alkyl, aminoalkyl, hydroxyalkyl, alkoxyalkyl, alkoxy carbonyl, acyloxymethoxycarbonyl or alkylamino optionally substituted by hydroxy, alkylamino, alkoxy, oxo, aryl or cycloalkyl;

20

each R_3 independently is R_1 , R_2 , amino, halo, cyano, nitro, thiol, alkylthio, alkylsulphonyl, alkylsulphenyl, alkylsulphonamido, alkylaminosulphonyl, haloalkoxy and haloalkyl;

25

each X independently is a C, N, O or S atom or a CO, CR_1 , $C(R_1)_2$ or NR_1 group, at least one X being C, CO, CR_1 or $C(R_1)_2$, with the proviso that if the benzamidine group is unsubstituted and the X-X group is $-CH_2C(R_1)_2-$ then R_1 is hydrogen or is attached to the alkylene carbon atom by a heteroatom;

30

L is an organic linker group containing 1 to 5 backbone atoms selected from C, N, O and S, or a branched alkyl or cyclic group;

Y is a nitrogen atom or a CR_1 group or Y and L taken together form a cyclic group;

35

Cy is a saturated or unsaturated, mono or poly cyclic, homo or heterocyclic group optionally substituted by groups R_3 or phenyl optionally substituted by R_3 ;

Lp is a lipophilic organic group, selected from an

- 97 -

alkyl, heterocyclic, alkenyl, alkaryl, cycloalkyl, polycycloalkyl, cycloalkenyl, aryl, aralkyl or haloalkyl group or a combination of two or more such groups optionally substituted by one or more of oxa, oxo, aza, thio, halo, amino, hydroxy or R_3 groups;

D is a hydrogen bond donor group; and n is 0, 1 or 2)

or a physiologically tolerable salt thereof.

2. A compound as claimed in claim 1 wherein R_1 represents hydrogen.

3. A compound as claimed in either one of claims 1 or 2 wherein R_2 is hydrogen, alkoxycarbonyl or hydroxy.

4. A compound as claimed in any one of claims 1 to 3 wherein R_3 is hydrogen, amino, aminoalkyl, alkylamino, hydroxy, hydroxyalkyl, thiol, alkylthio or alkoxy.

5. A compound as claimed in claim 4 wherein R_3 is para to the amidino group.

6. A compound as claimed in claim 5 wherein R_3 is amino.

7. A compounds as claimed in any one of claims 1 to 6 wherein the linker X-X is -CH=CH-, -CONH-, -CONR₁-, -NH-CO-, -NH-CH₂-, -CH₂-NH-, -CH₂O-, -OCH₂-, -COO-, -OC=O- or -CH₂CH₂-.

8. A compound as claimed in claim 7 wherein the X moiety nearest Y is NH.

9. A compound as claimed in claim 7 wherein the X moiety nearest the phenyl ring is CH₂ or CO.

- 98 -

10. A compound as claimed in claim 7 wherein X-X is
-CONH-.
11. A compound as claimed in any one of claims 1 to 10
5 wherein Y is CH.
12. A compound as claimed in any one of claims 1 to 11
wherein Cy represents aryl or heteroaryl optionally
substituted by R_3 .
- 10 13. A compound as claimed in claim 12 wherein R_3
represents phenyl optionally substituted by R_3 or naphthyl
optionally substituted by R_3 .
- 15 14. A compound as claimed in claim 13 wherein Cy
represents phenyl.
15. A compounds as claimed in any one of claims 1 to 14
wherein the linker L represents CO, CH_2NH , $CONR_1(CH_2)_m$,
20 $(CH_2)_mN(R_1)CO(CH_2)_m$, $(CH_2)_{m+2}$, $(CH_2)_mCO(CH_2)_m$, $(CH_2)_mOC=O$,
 $(CH_2)_mO$ or $CH=CH(CH_2)_m$ (where each m is independently 0 or
1).
16. A compound as claimed in claim 15 wherein the
25 linker L represents $CONR_1(CH_2)_m$, CO or CH_2NR_1CO where m is
0 or 1.
17. A compound as claimed in any one of claims 1 to 16
wherein said lipophilic group comprises cycloalkyl,
30 azacycloalkyl, diazacycloalkyl, phenyl, naphthyl,
adamantyl, decaliny, tetrahydrodecaliny, bicycloalkyl,
mono- or diazabicycloalkyl, mono- or bicyclo
heteroaromatic or a linear or branched alkyl, alkylene,
alkenyl or alkenylene group all optionally substituted
35 by one or more groups R_3 , or a combination of at least
two such groups linked by a spiro linkage or a single or
double bond or by C=O, O, S, SO, SO₂, $CONR_1$, NR_1-CO- , NR_1

- 99 -

linkage.

18. A compound as claimed in claim 17 wherein the lipophilic groups is a methyl-cyclohexyl, methylcyclohexylmethyl, methylphenylmethyl, phenylethyl, benzylpiperidinyl, benzoylpiperidinyl, bispiperidinyl or phenylpiperazinyl.
19. A compound as claimed in any one of claims 1 to 18 wherein the hydrogen bond donor group is attached to the lipophilic group.
20. A compound as claimed in claim 19 wherein nitrogen or oxygen is the hydrogen bond donor atom.
21. A compound as claimed in claim 20 wherein the hydrogen bond donor is formed from a hydroxyl group, a primary, secondary or tertiary amine, or a primary or secondary imine group as part of an amidine or guanidine or a saturated or unsaturated heterocyclic group containing 5 to 7 ring atoms and having a ring nitrogen.
22. A compound as claimed in any one of claims 1 to 21 wherein Y is carbon and preferably has the conformation that would result from construction from a D- α -aminoacid $\text{NH}_2\text{-CR}_1(\text{Cy})\text{-COOH}$.
23. A compound as claimed in any one of claims 1 to 22 wherein the serine protease to be inhibited is trypsin, thrombin, urokinase or Factor Xa.
24. A compound as claimed in claim 1 being 3-Amidino-benzoyl-D-phenylglycine-4-benzoyl piperidinamide.
25. A pharmaceutical composition comprising a serine protease inhibitor as claimed in any one of claims 1 to 24 together with at least one pharmaceutically

- 100 -

acceptable carrier or excipient.

26. A serine protease inhibitor as claimed in any one
of claims 1 to 24 for use in combatting a condition
5 responsive to said inhibitor.

27. Use of a serine protease inhibitor as claimed in
any one of claims 1 to 24 for the manufacture of a
medicament for use in a method of treatment of the human
10 or non-human animal body to combat a condition
responsive to said inhibitor.

28. A compound as claimed in claim 27 wherein said
condition is a thrombotic disease, asthma, emphysema,
15 cirrhosis, arthritis, carcinoma, melanoma, restenosis,
atheroma, trauma, shock and reperfusion injury.

29. A method of treatment of the human or non-human
animal body to combat a condition responsive to a serine
20 protease inhibitor, said method comprising administering
to said body an effective amount of a serine protease
inhibitor as claimed in any one of claims 1 to 24.

INTERNATIONAL SEARCH REPORT

national application No.

PCT/GB 98/02605

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 29
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim 29
is directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is
restricted to the invention first mentioned in the claims: it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

In view of the extremely large scope claimed through unspecific and inconcise expressions/notations like "organic linker", "cyclic group", "lipophilic group", "alkyl", "heterocyclic group" and the like, it is not possible to fully and clearly specify the matter for which protection is sought. This contravenes the PCT requirements (e.g., clarity and conciseness, Art. 6 PCT).

In other words, the scope is so large and the portion which is always present is so small that it is not possible to carry out a complete and meaningful search into the state of the art on the basis of the claims. The number of theoretically conceivable compounds resulting from the combination of all claimed substituents precludes a comprehensive search. "No special search effort need to be made for searching unduly wide or speculative claims" (Guidelines B-III, 3.7 and 3.12) and the costs of the search are "to be kept within reasonable bounds" (Guidelines B-III, 2.1).

Furthermore, many dissimilar structures are encompassed for which no evidence is in the description that they all are solution of the problem underlying the application, namely the provision of compounds inhibiting serine protease. As a matter of principle, a formula consisting virtually completely of variables is hardly a permissible generalisation which is fairly based on experimental evidence. All potentially novel and inventive subject-matter is hidden in this large amount of possible compounds (Art. 33 PCT).

The search has been limited to the subject-matter as illustrated by the prepared compounds for which the nomenclature is clear (Art. 17 PCT) and to the general idea (serine protease inhibitors) underlying the application.
